ASSIGNMENT HISTORY FOR US PATENT AVAILABLE IN LSUS DISPLAY FORMAT

AB Provided are certain methods of treating at least one condition that can be treated by elevating the vitamin D receptor (VDR) activity level in a patient with at least one farnesoid X receptor (FXR) agonist. Also provided are certain methods of modulating levels of Cytochrome P 450, family 27, subfamily B, polypeptide 1 (CYP27B1) and 1 $\alpha$ ,25-dihydroxyvitamin D3 in cells, certain methods of modulating VDR activity levels, certain methods of modulating levels of an extracellular matrix protein, renin angiotensin system (RAS) pathway, parathyroid hormone, serum creatinine, serum albumin, proteinuria, lipid metabolism, renal lipid deposition, mesangial expansion, glomerulosclerosis, kidney inflammation, blood pressure, bone resorption, and bone formation, certain methods of identifying FXR modulators, certain methods of diagnosing the risk that a patient will develop at least one condition that can be treated by elevating the VDR activity level, and certain methods of characterizing the levels of FXR activity in mammals.

ASSIGNMENT HISTORY FOR US PATENT AVAILABLE IN LSUS DISPLAY FORMAT				
AB The invention provides methods for treating nonalcoholic fatty liver disease with farnesoid X receptor (FXR) agonists. The invention also provides methods for modulating levels of keratinocyte-derived chemokine (KC), alanine aminotransferase (ALT), aspartate aminotransferase (AST), cytokeratin 18 (CK-18), matrix metalloproteinase-9 (MMP-9), matrix metalloproteinase-14 (MMP-14), tissue inhibitor of metalloproteinase 1 (TIMP-1), and Cytochrome P 450 2E1 (CYP2E1); methods for identifying FXR modulators; and methods for treating patients with existing cholesterol gallstone disease.

AB	The invention provides methods for treating at least one disease state characterized by elevated expression of the lectin-like oxidized low-d. lipoprotein receptor 1 (LOX-1) in a patient with farnesoid X receptor (FXR) agonists. Also provided are methods for reducing expression of LOX-1 in a cell with FXR agonists.

GI

- AB The invention relates to compds. of formula I, which exhibit affinity for the farnesoid X receptor (FXR). Compds. of formula I wherein R1 is CJR11, CJOR11, and CJNH2 and derivs.; J is a bond, O, and NH and derivs.; n is 0 to 4; R3 is H, acyl, and NH2 and derivs.; R6 and R7 are independently (un)substituted alkyl, (un)substituted cycloalkyl, and (un)substituted cycloalkylalkyl; R8 is OH, (un)substituted alkyl, (un)substituted cycloalkenyl, (un)substituted alkynyl, halo, haloalkyl, etc.; R11 is H, (un)substituted alkyl, (un)substituted alkenyl, (un)substituted alkynyl, (un)substituted cycloalkyl, etc.; and their pharmaceutically acceptable derivs. thereof, are claimed. Example compound II was prepared by acylation of iso-Pr 1,2,3,6-tetrahydroazepino[4,5-b]indole-5-carboxylate with benzoyl chloride. All the invention compds. were evaluated for their farnesoid X modulatory activity (data given).

 GI

AB The title compds. (I) [R1 = -C(J)OR14, -C(J)SR14, (un)substituted -C(J)NH2; J = O, S, (un)substituted NH; R2 = H, halo, (un)substituted alkyl; R3 = -C(O)R9; R4, R5, R6 and R7 are together selected from (a), (b), etc. below: (a) R4, R5 = H or halo and R6, R7 = halo, each (un)substituted alkyl, alkenyl, alkynyl, cycloalkyl, cycloalkylalkyl, heterocyclyl, heterocyclylalkyl, aryl, aralkyl, heteroaryl, or heteroaralkyl, etc.; or R6 and R7, together with the carbon atom to which they are attached, form each (un)substituted cycloalkyl, heterocyclyl, cycloalkenyl, alkylidene, cycloalkylidene, heterocyclylidene, aralkylidene or substituted heteroaralkylidene; (b) R4, R5 = halo, each (un)substituted alkyl, alkenyl, alkynyl, cycloalkyl, cycloalkylalkyl, heterocyclyl, heterocyclylalkyl, aryl, heteroaryl, or heteroaralkyl, etc.; or R4 and R5, together with the carbon atom to which they are attached, form (un)substituted cycloalkyl, heterocyclyl, cycloalkenyl, alkylidene, cycloalkylidene, heterocyclylidene, aralkylidene or heteroaralkylidene, and R6, R7 = H or halo; R8a, R8b, R8c, R8d = H, halo, pseudohalo, cyano, azido, amidino, guanidino, each (un)substituted alkyl, alkenyl, alkynyl, cycloalkyl, cycloalkylalkyl, heterocyclyl, heterocyclylalkyl, aryl, aralkyl, heteroaryl, or heteroaralkyl, etc.; R14 = each (un)substituted alkyl, alkenyl, alkynyl, cycloalkyl, cycloalkylalkyl, heterocyclyl, heterocyclylalkyl, etc.] are prepared. These compds. modulate nuclear receptors, in particular farnesoid X receptor and are agonists, partial agonists, inverse agonists, partial antagonists, or antagonists of farnesoid X receptor. They are useful for the treatment, prevention, or amelioration of one or more symptoms of disease or disorder directly or indirectly related to the activity of the above receptors, including hyperlipidemia, hypercholesterolemia, hypertriglyceridemia, dyslipidemia, lipodystrophy, atherosclerosis, atherosclerotic disease, atherosclerotic disease events, atherosclerotic cardiovascular disease, Syndrome X, diabetes mellitus, type II diabetes, insulin insensitivity, hyperglycemia, cholestasis and obesity. Thus, to a solution of Et 1,2,3,6-tetrahydroazepino[4,5-b]indole-5-carboxylate (52 mg, 0.2 mmol) in CH2Cl2 was added 4-fluorobenzoyl chloride (36  $\mu$ L, 0.2 mmol) and TEA (56  $\mu$ L, 0.4 mmol) and the mixture was shaken overnight at 20 $^{\circ}$ C, treated with Trisamine resin (50 mg), and shaken for 2 h at 20 $^{\circ}$ C. The resin was removed by filtration through a Florisil cartridge. Evaporation of solvent gave a crude product, which was purified by trituration with methanol to give Et 3-(4-fluorobenzoyl)-1,2,3,6-tetrahydroazepino[4,5-b]indole-5-carboxylate. Et 3-(3,4-difluorobenzoyl)-1-methyl-1,2,3,6-

tetrahydroazepino[4,5-b]indole-5-carboxylate was administered daily by oral gage for 7 days to young adult male mice. Plasma total cholesterol and triglyceride levels were significantly lowered.

GI

- AB Comps., compns., and methods are provided for modulating the activity of farnesoid X receptors, and for the treatment, prevention, or amelioration of one or more symptoms of diseases or disorders related to the activity of the receptors. In particular, compds. I are disclosed [wherein: X = O, S(O)O-2, NH or its alkyl, acylated, oxyacylated, or sulfonylated derivs.; Y = (un)substituted CH or N; Z = (un)substituted CH or N; or YZ bond is fused to a carbo- or heterocyclic ring, but not benzo or naphtho; R1, R2, R4-R7 = H, halo, (un)substituted alk(en/yn)yl, (hetero)aryl, numerous functional groups; R3 = H, (un)substituted alk(en/yn)yl, (hetero)aryl, numerous functional groups; R4R5 and/or R6R7 may form oxo, thioxo, (un)substituted imino or oxime or hydrazone, or an exocyclic double bond; or R4R5, R4R6, R4R7, R5R6, R5R7, and/or R6R7 may form ring(s); including isomer(s), solvates, polymorphs, prodrugs, and pharmaceutically acceptable salts]. Fifteen synthetic examples and several biol. examples are given. For instance, thiophene-3-acetonitrile was converted to invention compound II in four steps: (1) di- $\alpha$ -methylation using NaH and MeI in DMF; (2) reduction of the nitrile to a primary amine using LiAlH<sub>4</sub>; (3) cyclocondensation of the amine with Et bromopyruvate to form the azepine ring; and (4) N-acylation using 3,4-difluorobenzoyl chloride. II exhibited agonist activity at 100 nM or less, with > 100% efficacy (vs. CDCA), as measured in a co-transfection assay using full length human farnesoid X receptor.

AB The present invention is directed to azepinoindole and pyridoindole derivs. (shown as I and II; variables defined below; e.g. Et 1,2,3,6-tetrahydroazepino[4,5-b]indole-5-carboxylate). These compds. were used in pharmaceutical compns. and methods for modulating the activity of farnesoid X receptor and/or orphan nuclear receptors. A farnesoid X receptor/ECREx7 co-transfection assay and a TR-FRET assay were used to establish the EC50/IC50 values for potency and percent activity or inhibition for efficacy; efficacy defines the activity of a compound relative to a high control (chenodeoxycholic acid, CDCA) or a low control (DMSO/vehicle). Most of the compds. disclosed and tested exhibited activity in at least one of the assays (EC50 or IC50 <10  $\mu$ M); most showed activity at <1  $\mu$ M, e.g. Pr 3-(4-fluorobenzoyl)-2-methyl-1,2,3,6-tetrahydroazepino[4,5-b]indole-5-carboxylate exhibited agonist activity <1  $\mu$ M EC50 and >100 % efficacy and 8-(3-cyclopropyl-1-methylureido)-3-(4-fluorobenzoyl)-1,1-dimethyl-1,2,3,6-tetrahydroazepino[4,5-b]indole-5-carboxylic acid Et ester exhibited antagonist activity with IC50 <100 nM and 100 % inhibition. Although the methods of preparation are not claimed, 74 example preps. of I and II and characterization data for many more I and II are included. For I and II: n = 0-4; A is -N(R9)-, -O- or -S(O)t- (t = 0-2); R1 and R2 = H, alkyl, alkenyl, alkynyl, aryl, heteroaryl, cycloalkyl, heterocyclyl, aralkyl, heteroaralkyl, -OR14, -SR14, -N(R15)R16, -N(R15)S(O)2R43; -N(R17)N(R15)R16, -N(R17)N(R15)S(O)2R43, -C(O)R18, -C(O)OR14, -C(S)OR14, -C(O)SR14, -C(O)N(R15)R16, -C(O)N(R15)S(O)2R43, -C(O)N(R15)N:R16 and -C(O)N(R17)N(R15)R16; or -C(O)N(R17)N(R15)S(O)2R43; or R1 and R2, together with the atom to which they are attached, form a cycloalkyl, heterocyclyl, aryl, or heteroaryl ring. R3 is H, alkyl, alkenyl, alkynyl, cycloalkyl, aryl, aralkyl, heteroaryl, heterocyclyl, heteroaralkyl, -C(O)R10, -C(O)OR10, -S(O)2R10, -C(O)N(R11)R12, -C(O)N(R11)S(O)2R43, -C(O)N(R13)N(R11)R12, -C(O)N(R13)N(R11)S(O)2R43, -N(R13)C(O)N(R11)R12, -N(R13)C(O)N(R11)S(O)2R43, -N(R10)C(O)N(R13)N(R11)R12, -N(R10)C(O)N(R13)N(R11)S(O)2R43, -N(R13)C(O)OR10, -P(O)OR10, or -P(O)(OR19)OR12. R4, R5, R6 and R7 = H, alkyl, alkenyl, alkynyl, aryl, heteroaryl, cycloalkyl, heterocyclyl, aralkyl, heteroaralkyl, -OR14, -SR14, -S(O)2R14, -N(R15)R16, -N(R15)S(O)2R43, -C(O)R18, -C(O)OR20, -C(O)N(R21)R22, -C(O)N(R21)S(O)2R43; -C(O)N(R42)N(R21)R22; or -C(O)N(R42)N(R21)S(O)2R43; or R4 and R5, or R4

and R6, or R4 and R7, or R5 and R6, or R5 and R7, or R6 and R7, together with the C atom to which they are attached, form a cycloalkyl, heterocyclyl, or cycloalkenyl ring, or together form a double bond and the others of R4, R5, R6 and R7 are as described above; or R6 and R7 together form an exo, thioxo, imine, oxime or a hydrazone, or R6 and R7, together with the C atom to which they are attached, form an exocyclic double bond, and R4 and R5 are as described above. R8 = alkyl, alkenyl, alkynyl, aryl, heteroaryl, cycloalkyl, heterocyclyl, halo, pseudohalo, cyano, nitro, -C(O)OR23, -C(O)N(R24)R25, -C(O)N(R24)S(O)2R43, -C(O)R26, -OR27, -SR27, -C(S)OR23, -C(O)SR23, -N(R28)R29, and -N(R28)S(O)2R43, or two adjacent R8 groups, together with the carbons to which they are attached, form an aryl, cycloalkyl, heterocyclyl or heteroaryl; addnl. details including provisos are given in the claims.

AB The first synthesis of (+)-austamide (I), (+)-deoxyisoaustamide (II), and (+)-hydratoaustamide (III) by a very direct route is described. Starting from tryptophan Me ester intermediate (IV) is generated in two steps in >98% overall yield. The key step in the synthesis is a novel cyclization of IV involving organopalladium intermediates which gives the dihydroazocine V. From this key intermediate the target structures are accessible in just a few steps. The remarkable conversion of IV →

V can be rationalized by the mechanistic pathway that involves a multistep sequence which includes palladation, cyclization, and rearrangement.

AB Ibogaine, one of the psychoactive indole alkaloids found in the root bark of the West African shrub, *Tabernanthe iboga*, has purported efficacy in treating multiple forms of drug abuse. A single oral treatment with ibogaine or its salts, in the doses of 6 to 19 mg/kg, or a series of four treatments may, resp., eliminate addictive behavior for up to 6 mo or three years. In rats, ibogaine (40 mg/kg) decreases i.v. self-administration of both morphine and cocaine and oral self-administration of ethanol and nicotine. However, ibogaine also exerts several serious side effects including tremors, toxic degeneration of Purkinje cells in the brain and an acute depressant effect on responding for water in rats. Such side effects may restrict the use of ibogaine to treat human addictive disorders. These problems led us to develop novel synthetic ibogaine congeners that mimic ibogaine's therapeutic profile, but without side effects. 18-Methoxycoronaridine (18-MC) (I), a novel iboga alkaloid congener, has been synthesized and evaluated as a potential anti-addictive agent. Racemic I has been synthesized in 13 steps, with overall 7% yield. Both enantiomers of I have been obtained, either by chemical resolution of ( $\pm$ )-18-MC or by enantioselective total synthesis using chiral auxiliaries. Like ibogaine, I decreases the i.v. self-administration of morphine and cocaine and the oral self-administration of ethanol and nicotine in rats. However, I does not evidence ibogaine's side effects. Thus, I has potential as a safe and effective treatment for multiple forms of drug abuse.

AB The antianoxic, psychotropic and hemodynamic (no data) title compds. I (R, R4 = H, alkyl, PhCH2; R1, R2 = H, alkyl, R1R2 = alkanediyl; R3 = alkyl, R5 = H, O2N, alkoxy, halo, HO) and their addition salts were prepared. Thus, tryptamine-HCl was treated with Me 3-chloropyruvate followed by cyclization to give Me 1,2,3,4-tetrahydroazepino[4,5-b]indole-5-carboxylate, which was reduced by with NaBH3CN followed by cyclization with AcH to give to isomers of the methanoazepinoindolecarboxylate II. II was treated by PhCH2Br followed by rearrangement and hydrogenolysis to give I (R = R1 = R2 = R4 = R5 = H, R3 = Me).

AB 4,5,6,7-Tetrahydro-1-methyl-4-oxo-2,3-benzazepine (I) in its simple reactions resembles 1,2,3,4-tetrahydro-1-methyl-4-oxoquinoline (II), but its indolo (III) and quinolino derivs. (IV) differ markedly from those of II. The Fischer reaction with I phenylhydrazine (V) yields a true indole instead of a  $\psi$ -indole. The quinolino acid (VI) obtained by the Pfitzinger reaction does not show the marked resonance and deep color of the oxoquinoline derivative, and the corresponding base IV, obtained by decarboxylation of the acid or by direct application of the Friedlander reaction, does not undergo acid-catalyzed allylic rearrangement or ready oxidation to a cyclic amide. Dry HBr bubbled into absolute alc. at 0° until 100 g. absorbed, 67 g.  $\gamma$ -butyrolactone added, the mixture refluxed 4.5 hrs., and fractionally distilled gave 100 g. crude Br(CH<sub>2</sub>)<sub>3</sub>CO<sub>2</sub>Et (VIII), b<sub>14</sub> 85-7°, n<sub>D</sub> 1.451. Attempts to prepare the Me ester by analogous procedure were unsuccessful. VIII (100 g.) and 200 g. Me anthranilate (IX) heated 12 hrs. at 100°, the pasty crystalline mass shaken with 400 cc. H<sub>2</sub>O to which excess NaHCO<sub>3</sub> was gradually added, the mixture extracted with Et<sub>2</sub>O, dried, and distilled gave 150 g. unchanged IX,

b0.4 115-20°, and 75 g. Me N-(3-ethoxycarbonylpropyl)anthranilate (X), b<sub>0.07</sub> 176-80°, m. 43.5° (ligroine). X (5 g.) in 25 cc. aqueous alc. containing 7 g. KOH refluxed 1 hr., cooled, and acidified to pH 6 gave 3.9 g. diacid (XI), m. 190° (effervescence) (alc.). X (5 g.) in 20 cc. C<sub>5</sub>H<sub>5</sub>N treated gradually with 4.2 g. BzCl, heated 1 hr. at 50°, cooled, poured into 300 cc. H<sub>2</sub>O, the oil collected, washed, and fractionally distilled gave an almost quant. yield of Me N-benzoyl-N-(3-ethoxycarbonylpropyl)anthranilate (XII), b<sub>0.05</sub> 215-25°, m. 46° (Et<sub>2</sub>O-ligroine). XII (1 g.) was quant. hydrolyzed by refluxing 45 min. in 50% aqueous alc. containing 2 g. KOH and acidifying to give N-benzoyl-N-(3-carboxypropyl)anthranilic acid (XIII), m. 175° (aqueous alc.). Unsuccessful attempts to form the 7-membered ring of the benzazepine system were made. (a) XI treated with Ac<sub>2</sub>O and KOAc under a variety of conditions. (b) XII in xylene refluxed 9 hrs. with Na gave no ketonic product. X (30 g.) and 45 g. MeI heated 4 hrs. at 90° in an autoclave, the cold product added to 100 cc. H<sub>2</sub>O and 50 cc. Et<sub>2</sub>O and treated with excess NaHCO<sub>3</sub>, the mixture extracted with Et<sub>2</sub>O, dried, and evaporated gave 18 g. Me N-(3-ethoxycarbonylpropyl)-N-methylantranilate (XIV), b<sub>0.03</sub> 139°. In a typical Dieckmann cyclization a solution of 6 g. XIV in 35 cc. xylene added during 45 min. to a suspension of 1 g. Na in 120 cc. refluxing xylene under N, the refluxing continued 7-12 hrs., the excess Na decomposed, the xylene solution extracted with 6N HCl, the aqueous extract refluxed 45 min. in N, cooled, treated with NaHCO<sub>3</sub>, extracted with Et<sub>2</sub>O, and

fractionally distilled gave 1.8 g. I, b<sub>0.2</sub> 112° which did not crystalline; it was stable for several weeks under normal conditions. When the above procedure was repeated using PhMe to replace xylene a yield of 42% I was obtained; using 1 g. atom Na in xylene containing a trace of MeOH and refluxing 10 hrs. the yield was 42%. The Dieckmann reaction with Na in anhydrous C<sub>6</sub>H<sub>6</sub> containing a trace of MeOH gave 27% yield, and the use of NaH in dry C<sub>6</sub>H<sub>6</sub> gave only traces of ketonic material. I (0.5 g.) in 5 cc. alc. containing 2 cc. H<sub>2</sub>O treated under reflux 2 hrs. with 0.35 H<sub>2</sub>NCONHNH<sub>2</sub>.HCl and NaOAc gave 0.5 g. I semicarbazone, m. 198° (alc.); 2,4-dinitrophenylhydrazine, m. 202-3°; V, viscous sirup which did not crystalline; HCl salt, m. 160-1° (decomposition) (alc.); picrate, not pure. All attempts to isolate crystalline products of condensation between the 5-CH<sub>2</sub> group of I and p-Me<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>CHO or p-ONC<sub>6</sub>H<sub>4</sub>NMe<sub>2</sub> failed; the former reagent gave no reaction, and the latter gave intractable tars. V (from 1.4 g. I) refluxed 8 hrs. in a mixture of saturated alc. HCl and alc., cooled 2 hrs. at 0°, and the product collected gave 2.1 g. 6,7-dihydro-1-methyl-2,3-benzindolo[2,3',4,5]azepine-HCl (XV), m. 235° (effervescence). An aqueous alc. solution of XV basified with 10% aqueous NaOH gave the free indolo compound (III), m. 119° (aqueous alc.). III is completely stable when exposed to air; a slow and partial oxidation occurs in hot Me<sub>2</sub>CO/KMnO<sub>4</sub>, but no pure derivative was isolated. III shows infrared absorption maximum at 3420 and 3380 and a shoulder at 2800 cm.<sup>-1</sup> The similarity between the ultraviolet spectra of III in alc. and in alc. HCl accords with the protonation of the benzazepine-N atom rather than that of a  $\psi$ -indole. Unsuccessful attempts were also made to dehydrogenate III at the saturated 6,7-linkage, by reagents such as Pd-C or chloranil. Isatin (1.4 g.) and 1.7 g. KOH in 5 cc. H<sub>2</sub>O refluxed 10 hrs. with 1.4 g. I in 10 cc. alc. gave 0.75 g. 6,7-dihydro-1-methyl-2,3-benzoquinolino [2',3',4,5] azepine-4'-carboxylic acid (VI), m. 295° (slow effervescence). I (0.7 g.) in 10 cc. warm alc. treated with 0.5 g. o-H<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>CHO and left at room temperature 1 week under N gave 0.8 g. 6,7-dihydro-1-methyl-2,3-benzoquinolino[2',3'-4,5]azepine (IV), m. 127° (aqueous alc.). IV distills smoothly in the sublimation tube at 300°/15 mm. without change. VI heated in a tube at 0.002 mm. sublimed at 250-310° without residue. The yellow crystalline sublimate was identical with unchanged VI. In a similar experiment at 15 mm. a clear viscous orange distillate was obtained at 300°. This product was shown by infrared and chromatographic analysis to be almost pure IV contaminated with traces of VI. IV formed an unstable MeI salt, m. 210-11° (effervescence) (Me<sub>2</sub>CO containing a trace of MeOH); HCl salt, m. 194-6°; di-HCl salt, m. 200-5° (deep red melt). Attempts to effect the acid-catalyzed isomerization of IV gave the unchanged base or its HCl salt almost quant. after refluxing in dilute HCl for 4 hrs., or in concentrated HCl containing a small amount of dioxane. Identification was confirmed by infrared spectroscopy. IV (50 mg.) in 10 cc. Me<sub>2</sub>CO treated during 2 hrs. with an excess of saturated Me<sub>2</sub>CO-KMnO<sub>4</sub>, the solution refluxed until the color disappeared, cooled, filtered, the filtrate concentrated, filtered again, and cooled gave 50 mg. 6,7-dihydro - 1 - methyl - 7 - oxo - 2,3 - benzoquinolino [2',3' - 4,5]-azepine (XVI), m. 192-3° (aqueous alc.). XVI cannot be obtained at room temperature by atmospheric oxidation in C<sub>6</sub>H<sub>6</sub> or by KMnO<sub>4</sub> oxidation in Me<sub>2</sub>CO, does not form a stable HCl salt and does not react with 2,4-dinitrophenylhydrazine. The disappearance of the N-Me infrared absorption band, the lack of ketonic properties, and the very low basic strength show that this oxidation product is the 7-oxo and not the 6-oxo isomer, which should be ketonic and

should absorb in the 2800 cm.<sup>-1</sup> region. Infrared absorption due to the CO group occurs at 1660 cm.<sup>-1</sup> The marked differences between the derivs. of I and II brought about solely by the insertion of one addnl. CH<sub>2</sub> group into the oxo amine ring of II, are particularly interesting in connection with the structural features required to facilitate the allylic transformation.
